Hey Really sorry for late reply.

Here is the detailed summary of answers:-

1. The tech stack I am aware of and what I use most of the time is MERN Stack. I have made several projects in the tech stack and building more and more.

2. Yes I can make web application of the given app.

   a. According to me, the hardest part of making the app will be the updating part of the videos and the followers listing. That part is the hardest one, loading the videos to the user or specific videos which they love. Regular database updates and all is very hectic. But I will take help from ai tools like chatgpt and more to help me where I am stuck, they are really helpfull in that case. If I am working on this project I will just go through the docs and search over internet for the issue and will resolve it.

   b. The key features of the app are like reels. Users who are interested, specific videos will be visible to them which they love. The follower section, where they can get their social information. Additionally there is a shop section as well where users can buy the thing which they are interested in, a very interesting section. A inbox section where all the messages will be shown.

   c. I think It will take around 2-3 months or may be less to implement all the feature listed by me.

   d. I don't have a stipend right now.

   e. I am not on a notice period.

So these were all the things/answers to all the questions provided by you. Hope they are conscise and understandable.
